Intertrial S-DNP-centric Analogies for the Enhancement of an AI-centric Construct Validity Approach

Author(s):
Steve Chan

Keywords: artificial intelligence systems; machine learning; construct validity; explainability; interpretability.

Abstract:
This paper describes an Artificial Intelligence (AI)-based Construct Validity Verification Methodology (CVVM) being advanced. The methodology is based on the Sensitivity-Diagnosticity-Parsimony (S-DNP) centric Finite Change Shapley Chain value along with, among others, Generic Shapley-Owen values and Variance-Based Shapley-Owen values. The paper describes the methodology's use, implementation, Criterion Importance through Intercriteria Correlation (CRITIC), and Preference Ranking Organization Method for Enrichment Evaluations (PROMETHEE) analogies, and interpretability of not only the machine learning constituent components but also the analogies. The analogies are made between/among individual components as well as analogies/clusters of components. The CVVM is being advanced for Intertrial Analytics and Software current proposals for the utilization of SNNP in local, global, and group (a hybridized intermediary of local and global) analytics. The CVVM is being advanced for Intertrial Analytics (ISA), by better correlating features with each interim intertrial construct, potentially wages to better interpretability and construct validity. The methodology is being advanced for ISA because particularly when ISA is conjoined with a well-conceptualized Multi-Criteria Decision Analysis (MCDA) Sensitivity-Diagnosticity-Parsimony (MCDSDP) Subjective Measures (SMS)/Objective Measures (OM) Analogy, it can be used to better inform the Multi-Criteria Decision Optimization (MCO) Robust Convex Relaxation (RCR) Long Short-Term Memory (LSTM) Deep Convolutional Neural Network (DCNN) (CPNN2) metabaseline architectural construct.
